

Video Card (Graphics Adaptor)

Any bog standard graphics adaptor will do for linux. Optimally you will want to have an SVGA adaptor in your PC that has enough RAM to support resolutions of at least 1024×768. Graphics Accelerator cards of many types are supported by today's modern distributions for even faster graphics. If you're looking for really good graphics performance under Linux, the NVidia range are an excellent choice, because they are well supported under Linux by Nvidia. ATI cards are also popular, however their driver support for Linux does not appear to be as good as NVidia's, which seems to be an ongoing issue with ATI. If you don't know what card you have in your machine, visit your device manager in Windows, or System Preferences in Mac OS. Integrated graphics chipsets such as the Intel i Series or Cirrus Logic on board chips like those found in modest-price laptops generally work well, however if you need 3D graphics performance, or intend on playing games, you are best using a 3D accelerated graphics card/chip from the likes of Nvidia or ATI.

- Minimum Specification: A standard graphics card capable of 1024×768 resolution (pretty much all graphics cards since the mid-late 1990s).
- Recommended Specification: 3D Accelerated Graphics card with at least 256MB graphics RAM.
