

Partitioning disks

Since as far back as 2007, it has been possible to re-partition your disk drive during the Linux installation process. This makes it far easier to do, so this guide has been updated to follow this process.

For those of you that prefer a visual demonstration of how to install Linux alongside Windows, there is a video at the end of this guide.

Tux tip!

If you still want to partition your hard drive before installing Linux, for example if you want completely granular control of how you split up your disk partitions, even after you have installed Linux, then you can use a tool like [GParted](#), or [these others](#) to partition your disk so that you can create some free space to put Linux onto.
